R² vs market

A · Cumulative return against the market it trades

B · Every drawdown, and the longest one (worst -28.0%, longest 42 months)

C · Return by regime

D · Market neutrality

E · Bootstrap: Sharpe ratio

F · Bootstrap: maximum drawdown

G · Why the deferred contract is the right hedge

Panels A-F are computed from data/derived/monthly_pnl.csv and benchmarks.csv, the committed series that 'make verify' re-checks against the headline table.

Panels E and F resample 6-month blocks 2,000 times, preserving runs of consecutive losing months; reshuffling months independently would understate the drawdowns actually.

Panel G is quoted from docs/FINAL_NUMBERS.txt section 4: it requires the price file and is not reproducible from the derived series alone.

Regime boundaries in panel C are the labels used in the text; every value inside them is computed. Repository: github.com/albertoramirez77/algo_app
