

# The Same Barrel — bootstrap analysis

183 monthly observations, 100 block-bootstrap paths shown, 2000 used for intervals, 6-month blocks

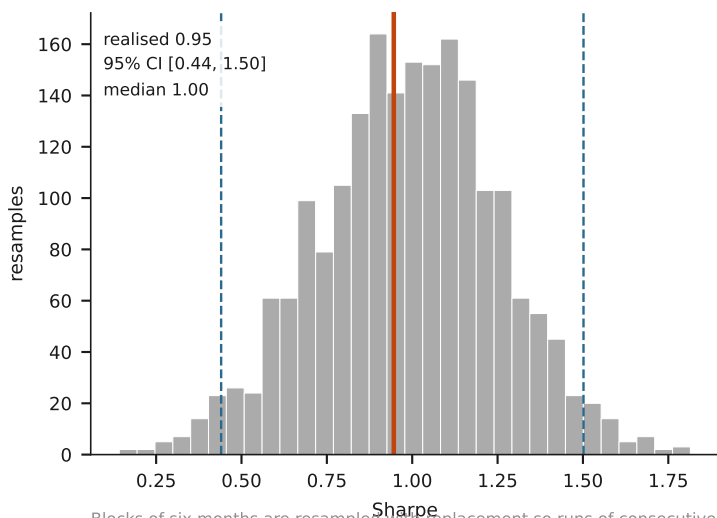

## 1 • Cumulative return, strategy against its own market

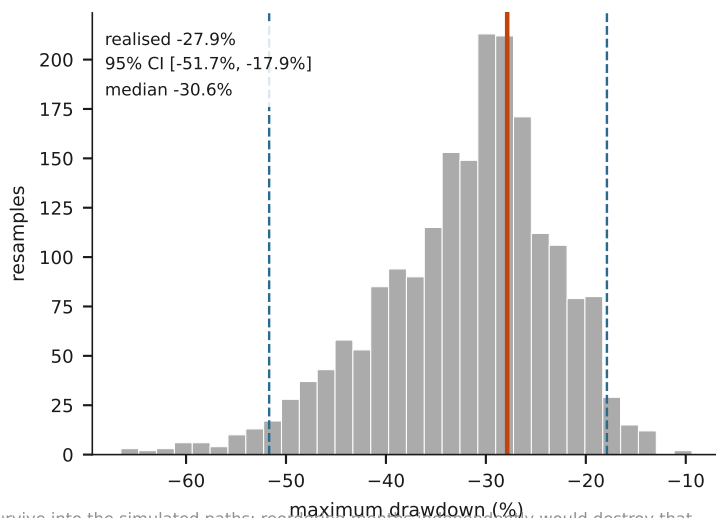

## 2 • The decay question, in one picture

## 3 • Sharpe ratio

## 4 • Maximum drawdown

Blocks of six months are resampled with replacement so runs of consecutive losses survive into the simulated paths; reordering months independently would destroy that clustering and produce drawdown distributions far milder than anything achievable in practice. Red line is the realised value, dashed lines the 2.5th and 97.5th percentiles.
