

The Same Barrel — Supporting Exhibits

16 CME commodity futures, 2010-06 to 2026-07, 183 monthly observations, net of 3bp per side

1 • Hedge quality tracks economic proximity

2 • Equity curve and drawdown

3 • Placebo: signal, not machinery

4 • Parameter surface is a plateau

5 • Trade statistics, monthly

Rebalances (months)	183
Winning months	61%
Average winning month	+4.95%
Average losing month	-3.74%
Win / loss ratio	1.33
Profit factor	2.04
Annual return, net	+18.40%
Cost / gross profit	2.6%
Annualised volatility	19.5%
Sharpe ratio, net	0.95
Maximum drawdown	-27.9%
Longest drawdown (mo)	42
Best / worst month	+17.8% / -16.2%
Contracts / month	21
Days holding a position	94%

6 • Drawdowns that could have occurred

Panels 2, 5 and 6 use the tranced book marked daily. Panels 3 and 4 use the single-grid monthly book, since a placebo and a parameter sweep are properties of the signal rather than of the rebalancing schedule; panel 1 is computed from daily returns and involves no portfolio. Panel 6 resamples six-month blocks with replacement so runs of consecutive losses survive into the paths.
